What I learned

While working on this assignment, I learned how to create a responsive dashboard in Flutter using different layout widgets. I understood how `ListView` can be used to make the dashboard scrollable and how `GridView` can arrange multiple options in a clean layout. I also learned how `MediaQuery` helps in detecting the screen size and adjusting the number of columns according to the available space.

I also got a better understanding of `Row`, `Column`, `Expanded`, and `Flexible`. Initially, it was difficult to understand how these widgets manage the available space, especially when placing multiple cards in the same row. Using `Expanded` helped me divide the available space properly, while `Flexible` helped prevent content from overflowing on smaller screens.

One of the main difficulties I faced was arranging the sidebar and dashboard content correctly. At first, the dashboard looked too basic and the cards had too much empty space. I had to adjust the padding, spacing, card sizes, and alignment to make the interface look more organized. Making the dashboard elements clickable was another part I had to understand, especially using `InkWell` and `Navigator` to move between different pages.

Overall, this assignment helped me understand that responsive design is not only about making the application look good on one screen size. The layout should also adjust according to the available space while remaining easy to use. I also gained practical experience in combining different Flutter widgets to build a simple but functional dashboard instead of creating only a static interface.
