What I learn

While working on this Flutter assignment, I learned how to create a multi-screen Flutter application using **named routes**. I created three different screens: Home, Form, and Detail. Instead of directly navigating between screens, I learned how to define route names inside `MaterialApp` and use them for navigation. This made the application structure more organized and helped me understand how different pages can be connected in a Flutter project.

I also learned how to create a **registration form** using Flutter form widgets such as `Form`, `TextFormField`, and `ElevatedButton`. I understood that forms are useful when we need to collect information from users, such as their name, email, and password. I used controllers and form fields to accept user input and learned how the entered data can be handled when the user submits the form.

One of the main things I learned in this assignment was **form validation**. I implemented validation for required fields, email format, and password input. If a user leaves a required field empty or enters an invalid email, the application displays an error message instead of accepting the form. This helped me understand why validation is important because it prevents incorrect or incomplete information from being submitted.

I also learned how to use `GlobalKey<FormState>` and the `validate()` method to check whether all the fields in the form are valid. After successful validation, the user can move to the Detail screen and see the submitted information. This helped me understand how data can be passed from one screen to another while navigating through an application.

Overall, this assignment gave me a better understanding of **screen navigation, named routes, forms, user input, and validation in Flutter**. I also learned how to divide an application into separate screens instead of keeping everything inside one file or one screen. The assignment helped me understand the basic structure required for building a simple Flutter application where users can enter information and move through different screens in a proper flow.
